

General Comments/Questions

1. One question is would each market participant have a number of separate accounts ? We would definitely like to see this. Tentatively we would be interested in having 5 to 10 accounts.

2. Assuming that each market participant had a number of accounts we would like to see the capability to share filters between accounts that belong to the same market participant.

3. There is a useful feature that allows modification of attributes on more than one OR simultaneously (ref. section 2.7 of IESO_SPEC_0249). It would be very useful if outages could be linked and moved simultaneously. For example for Nuclear ramp up slips we often have a sequence of back to back slips and it would be useful to be able to link these slips and move them all at once. Would it be possible to add this functionality ?

4. When and what form will user acceptance testing take on? Will users be able to provide comments that will then be incorporated in the finished product or will the testing simply be confirming that the functionality behaves as expected ?

5. It would be nice if there was barchart capability in the program.
